Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                       /note="vector: pAMPIO; Site_1: Not1; Site_2: EcoRI; 1st strand cDNA was primed with oligo(dT)17 on 50 ng of DNAse-treated, total cellular RNA obtained from 5,000-10,000 microdissected, histologically normal prostate epithelial cells. Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subclonded into pAMPIO by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."

strand cDNA was primed with oligo(dT)17 on 50 ng of
DNAse-treated, total cellular RNA obtained from 5,000-10
,000 microdissected, histologically normal prostate
epitchelial cells. Double-stranded cDNA was ligated to
EcoRI adaptors, 5 cycles of PCR applied to the cDNA with
an adaptor-specific primer, and the resulting PCR product
subcloned into pAMP10 by the UDG-cloning method (Life
Technologies). Average insert size is 600 bp. NOTE: Not
directionally cloned. This library was constructed by

Sequence 980, Application US/09822827

Patent No. US20020081680A1

GENERAL INFORMATION:

TITLE OF INVENTION: COMPOSITIONS AND METHODS FOR THE THERAPY AND

TITLE OF INVENTION: DIAGNOSIS OF PROSTATE CANCER

FILE REFERENCE: 210121.534C1

CURRENT APPLICATION NUMBER: US/09/822,827

WUMBER OF SEQ ID NOS: 982

SOFTWARE: FastSEQ for Windows Version 3.0

SEQ ID NO 980

LENGTH: 2406
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 5, Application US/09755100

Sequence 603, Application US/09925300

Patent No. US20020151681A1

GENERAL INFORMATION:

APPLICANT: Card Rosen,

APPLICANT: Steve Ruben

TITLE OF INVENTION: Nucleic Acids, Proteins and Antibodies

FILE REFERENCE: PAIO.

CURRENT APPLICATION NUMBER: US/09/925,300

CURRENT FILING DATE: 2001-08-10

PRIOR APPLICATION NUMBER: PCT/US00/05988

PRIOR PILING DATE: 1000-03-08

PRIOR APPLICATION NUMBER: 60/124,270

PRIOR PILING DATE: 1999-03-12

NUMBER OF SEQ ID NOS: 1890

SOFTWARE: PatentIN Ver. 2.0

SEQ ID NO 603

LENGTH: 1168

TYPE: DNA

ORANISM: Homo sapiens

FEATURE:

NAME/KET misc feature

Pred. No. is the number of results predicted by chance to have a

em\_htgo\_other:\*

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The peptides of the invention are used to prepare a medicament to elicit an immune response in an animal. They are used to treat cancer such as prostate cancer and tumour metastasis. They are also useful for prophylaxis, for preparing monoclonal or polyclonal antibodies, and in conventional techniques of immunology, molecular biology, cell biology and recombinant DNA technology. The present sequence is a DNA encoding PSA derived peptide, CLP313.
                     Claim 6; Page 38; 49pp; English.
                                          Treatment of benign prostatic hyperplasia or prostatic cancer using an anti-sense oligo:nucleotide targeted against prostate specific antigen or the probasin gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                             AAT61707;

```
cc comprises administering to the patient a therapeutic amount of a comprises administering to the patient a therapeutic amount of a cc composition comprising an antisense oligonucleotide which selectively hybridises to prostate specific antigen (PSA) gene or mRNA or to a c probasin gene or mRNA sequence of the patient, where the antisense coligonucleotide inhibits expression of the sequence. The present c sequence represents a specifically claimed antisense oligonucleotide can be used to effectively inhibit the growth of (and for the killing of) c where the state of the patient of the killing of) c where the sequence of the present of the used to effectively inhibit the growth of (and for the killing of) c hyperplastic cells or cancerous cells or prostate cells of the the properties of the prostation of the PSA and probasin genes is specific to prostate cells so that the cantisense oligonucleotide can be administered systemically, making it particularly useful in late stage prostatic cancer which has metasoned the particularly and in which the cells have become resistant to oestrogen cor anti-androgen therapy. The method can also be used in benign prostate hyperplasia, or early stage prostatic cancer, as an alternative for the core radical procedures currently used, such as transurethral resection, creative the prostate concer andical prostatectomy, or physical or chemical castration.

Recombinant fragments tests prostate-specific antigen (PSA) and immunological for use as an immunoassay calibrator in commercial PSA

Claim 3; Page 5; 19pp; English.

AAT35293-T35295 represent amplification primers for the prostate specific antigen (PSA). These primers were used to insert the CDNA for PSA into a BamHI-NotI-cleaved pVL1939 baculovirus transfer vector. The vector that was produced is ATCC VR-2496. The rPSA can produced by the vector can be used as an immunoassay calibrator. The immunoassays that use the rPSA are for the quantitative determination of PSA in a biological sample. In the assay, the test sample is combined with a

messenger RNAs that populate a (sub-)transcriptome, where the CC (sub-)transcriptome comprises messenger RNAs transcribed from multiple CC transcription units that populate a genome. The library comprises CC several oligonucleotides, each capable of hybridising selectively to a set of messenger RNAs transcribed from a given transcription unit of CC the genome, which encodes one or more messenger RNA splice variants. The oligonucleotide libraries are useful for detecting RNAs from a biological sample, in expression profiling studies, in qualitatively or quantitatively characterising the corresponding transcriptome, and in CC detecting RNA transcripts and splice variants of human or animal CC transcriptomes. The libraries may also be used as specialised mini CC libraries to detect transcripts of a sub-transcriptome under a CC particular biological or pathological state, and so allowing the CC detection of tissue and pathology-specific genes such as those genes conjuction; to detect developmental specific pathological condition; to detect developmental specific pa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       RESULT ABN3601

                                 analyte can be detected by analysing the diffraction pattern of the transmitted light. The method of the present invention may used to detect and quantify a variety of analytes, e.g. midropranisms, viruses, nucleic acids, hormones, steroids, antibodies, drugd, metals and antigens, either for clinical diagnosis of infections, cancer-and allergies or for detecting microbial contamination of garments. The present sequence is a synthetic oligonucleotide, which was used as an analyte to illustrate the
                                                                                                                          The present invention relates to a method for detecting and quantifying the presence or amount of an analyte within la medium. The method comprises micro-contact printing of analyte specific receptors onto polymer film. The target analyte binds to the polymer film, and results in light diffraction when light is transmitted through the film. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N.B. The sequence data for this patent did no specification, but was obtained in electronic at ftp.wipo.int/pub/published_pct_sequences.

                                        The invention provides a method of determining prostate specific antigen (pPSA) in a sample which involves determining the amount of complex formed on treating a sample with a pPSA specific antibody. The method is useful for detecting prostate cancer and distinguishing it from benign prostatic disease. The present sequence represents a DNA encoding a partial fragment of the PSA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        sig_peptide

                                                                                                                                                                                                                                cDNA sequences AAT92974-77 encode the prostate specific antigen (PSA). The detection of PSA mRNA in peripheral blood is associated with metastatic prostate cancer. Detection of PSA mRNA in the bloodstream indicates that prostate cells are circulating in the blood and confirms diagnosis of cancer. Circulating prostate cells also indicate a risk of a secondary tumour or bone metastatic anchoring. Detection of the PSA mRNA after prostatectomy or radiotherapy indicates a risk that the prostate cancer has spread and that the surgery and radiotherapy was not effective. PCR primers AAT92971-73 were used for the monitoring and diagnosis of patients with prostate cancer. The method comprises the detection of PSA mRNA by reverse transcriptase polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diagnosis; prostate cancer; prostate specific antigen; PSA; metastatic prostate cancer; prostate cell; secondary tumour; bone metastatic anchoring; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Monitoring or diagnosis of prostate cancer - by detecting prostate-specific antigen mRNA using specific primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cDNA for prostate specific antigen (PSA).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          24-APR-1998

                                                                                                                                                                                                                                                        AAT35293-T35295 represent amplification primers for the prostate specific antigen (PSA). These primers were used to insert the cDNA for PSA into a BamHI-NotI-cleaved pVL1393 baculovirus transfer vector. The vector that was produced is ATCC VR-2496. The rPSA can produced by the vector can be used as an immunoassay calibrator. The immunoassays that use the rPSA are for the quantitative determination of PSA in a biological sample. In the assay, the test sample is combined with a labelled conjugate and the response of the conjugate is compared to a standard curve established by performing the assay on one or more calibrators using rPSA (or an immunologically reactive fragment).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of t specification or its complement. (I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, uses

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:
(a) assessing whether a patient is affilicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, used for detecting presence of prostate cancer, stage of prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 308 BP; 65 A; 100 C; 79 G; 63 T; 1 other;

The invention relates to an isolated nucleic acid molecule (1) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV062213) of the specification or its complement. (1) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel isolated nucleic acid molecule associated with cancerous state prostate cells and correlating with presence of prostate cancer, used for detecting presence of prostate cancer, stage of prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                             (c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient; (d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient; in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 1; Page 7668; 11750pp; English.
                                                                                                                                         Sequence 428 BP; 82 A; 132 C; 123 G; 91 T; 0 other;
                                                                                                                                                                                                       patient;(I) is also useful as a pharmacodyanamic or pharmacogenomic marker.
                                                                                                                                                                                                                                                               (e) selecting a composition for inhibiting prostate cancer in a patient; (f) assessing the prostate cell carcinogenic potential of a compound; (g) determining whether prostate cancer has metastasized in a patient; (h) assessing the aggressiveness or indolence of prostate cancer in a

Nucleic acid synthesis using primer containing a sequence identical to one on the template for isothermal amplification using simple reagents

Example 8 Fig 17; 95pp; Japanese.

CCCCXXXX The invention relates to a novel method of isothermal DNA amplification. A region is produced at the 3' end of a target sequence which contains sub-sequences designated F1, F2C and F1C, where F1C is the complement of F1. A loop is formed by annealing of F1 to its complementary sequence

The resent invention describes a new method for synthesising nucleic acids comprising: (a) preparing a nucleic acid, with an F2c region, able to form a loop by annealing the F1 region of the 3' end to the F1c region on the same chain; (b) synthesis of a complementary chain using the 3' end of F1 as the starting point; (c) replacing the complementary chain by annealing an oligonucleotide containing F2, (complementary to F2c) at its 3' end and using it as a starting point for complementary chain synthesis by a polymerase; and (d) replacing the chain synthesised in step c by annealing a polynucleotide containing a region complementary to a part of the chain and using it 3' end as the starting point. Also described are: (1) a kit for synthesising nucleic acids; and (2) a kit for detecting target base sequences. The present sequence represents a prostate specific antigen related nucleotide containing a region is sequence, which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   template is synthesised using a DNA polymerase, and the process is repeated using sub-sequences at the 3' end of the complementary strand designated R1, R2C and R1C, using a primer containing R2 at its 3' end. The invention also encompasses primers for the method of the invention, and methods for the detection of a nucleic acid sequence in a sample using a labeled probe containing a sequence complementary to the loop region of the target sequence. The method of the invention provides an efficient and highly specific method for isothermal amplification of a target nucleic acid sequence using a simple reagent mixture. The present sequence represents a prostate specific antigen (PSA)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Unidentified
                                                                                                                                                                                                                                                                                                                                                                                                                              Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthesizing

                                                                                                                                                                           The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;

(b) monitoring the progression of prostate cancer in a patient;

(c) assessing the efficacy of a test compound to inhibit prostate

                                                                                                                                               The invention relates to a method of immunization against prostatic cancer (PC) by administering a nucleic acid (this sequence) that encodes prostate-specific antigen (PSA), or its immunologically active fragment, cells and then expressed to generate an immune response against PSA. The method is used to protect against, or treat, PC, or more generally to induce a cellular immune response to PSA;

Pred. No. and is No. is the number of results predicted by chance to have a greater than or equal to the score of the result being printed, s derived by analysis of the total score distribution.

Double-stranded cDNA was ligated to EcoRI adaptors, 5 cycles of PCR applied to the cDNA with an adaptor-specific primer, and the resulting PCR product subcloned into pAMP10 by the UDG-cloning method (Life Technologies). Average insert size is 600 bp. NOTE: Not directionally cloned. This library was constructed by David Krizman."
